[Thank you for supporting this humanitarian cause!](#)

The process is a safe, effective, proprietary acidic liquid compound and is gently applied onto the lesion. The liquid instantly constricts the lesion's capillaries, turning it white & restricting its nutrient supply. A scab forms in a few days & drops off in a few weeks, leaving esthetically pleasing skin. The best results are achieved with any size growths on the face. Mild de-pigmentation may occasionally occur on the arms, legs, & torso, especially when melanin-containing or cancer-prone flat areas are treated. Once a deeper layer of pigment has been exposed, it can be safely retreated until the removal is complete.
